Build Guide: Power BI Sales Dashboard

Beginner-friendly steps to turn the included dataset into a working .pbix

1. Import the data

In Power BI Desktop, use Get data → Text/CSV. Import Sales.csv first, then the Date, Customer, Product, SalesRep and Region CSVs. Choose Load or Transform Data to inspect the tables.

2. Clean and set data types

Set OrderDate and Date to Date. Set Quantity, Year, MonthNumber to whole number. Set DiscountPct to Decimal Number and format as percentage. Set NetSales, Profit, GrossSales, TotalCost and UnitCost to decimal/currency. Check for blank OrderIDs and duplicate OrderIDs.

3. Create relationships

Create Date[Date] → Sales[OrderDate] as one-to-many, single direction. Connect Customer[CustomerID] → Sales[CustomerID], Product[Product] → Sales[Product], SalesRep[SalesRep] → Sales[SalesRep], and Region[Region] → Sales[Region]. Set Date as the date table. Because descriptive fields are repeated in Sales for easier practice, use dimension fields in slicers and visuals where possible.

4. Add DAX measures

Open powerbi/DAX_Measures.txt. In Power BI, select the Sales table and create each measure via New measure. Validate realized revenue against a table visual filtered to OrderStatus = Won. Validate open pipeline separately using OrderStatus = Open.

5. Build the report

Page 1: add cards for Realized Revenue, Gross Profit, Won Orders and Win Rate; a line chart with Date[YearMonth] and Realized Revenue; a bar chart with Region and Realized Revenue; and slicers for date, region, channel and category. Sort YearMonth by a proper month-start field if needed.

Page 2: add a ranked bar chart for SalesRep, a channel comparison chart, a status breakdown, and Open Pipeline Value by region/channel.

Page 3: add revenue/profit by category and product, a profit margin visual, and a scatter chart with DiscountPct and Profit. Make sure filters are applied consistently.

6. QA checklist

■ Realized Revenue only includes Won orders.

■ Open Pipeline Value only includes Open orders.

■ Win Rate uses Won Orders divided by Total Orders.

■ Date slicers filter every visual as expected.

■ No real employer/customer data is included.

■ Measure names, chart titles and number formats are clear.

■ Save as Sales_Revenue_Intelligence.pbix.

7. Publish a shareable portfolio

Create a public GitHub repository called sales-revenue-intelligence-dashboard. Upload the README, data, powerbi, sql and documentation folders. Add the repository URL to your resume. For an interactive report, publish to Power BI Service only if your account supports sharing and you are comfortable with the report's visibility settings. Never publish confidential data.

Resume wording

While still building: “Sales & Revenue Intelligence Dashboard (In Progress) — Power BI, DAX, Power Query, SQL. Preparing a dashboard using 1,800 synthetic order records to analyze revenue, profit, win rate and open pipeline by time, region, product, channel and salesperson.” Once built and validated, update the wording to “Built” and link the repository.
